Homework 5 - Densities and volumes

Q5.1. Explain the conceptual difference between $\rho \equiv \frac{\rho}{\epsilon}$ and $\rho = \frac{\epsilon}{\epsilon}$ in three dimensions.

Q5.2. Show that

(a)
$$\boldsymbol{\epsilon}^{-1} \cdot (\vec{v} \cdot \boldsymbol{\epsilon}) = \vec{v} \tag{Q5.2.1}$$

(b)
$$\boldsymbol{\epsilon}^{-1} \cdot [(\vec{u} \wedge \vec{v}) \cdot \boldsymbol{\epsilon}] = \vec{u} \wedge \vec{v}$$
 (Q5.2.2)

Q5.3. Show that for an $m\text{-form }\boldsymbol{\omega}$ and an $n\text{-vector }\boldsymbol{v}$ with $m\leq n$

(a)
$$(\star \boldsymbol{\omega}) \cdot (\star \boldsymbol{v}) = \boldsymbol{\omega} \cdot \boldsymbol{v} \tag{Q5.3.1}$$

(b)
$$\star^{-1} (\boldsymbol{\omega} \wedge \star \boldsymbol{v}) = \boldsymbol{v} \cdot \boldsymbol{\omega}$$
 (Q5.3.2)

Q5.4. Show that

$$\nabla \cdot \nabla \cdot \boldsymbol{v} = 0 \tag{Q5.4.1}$$

for any multivector \boldsymbol{v} . What traditional vector calculus results does this correspond to?
